

Princess Aya Webpage Tamagotchi

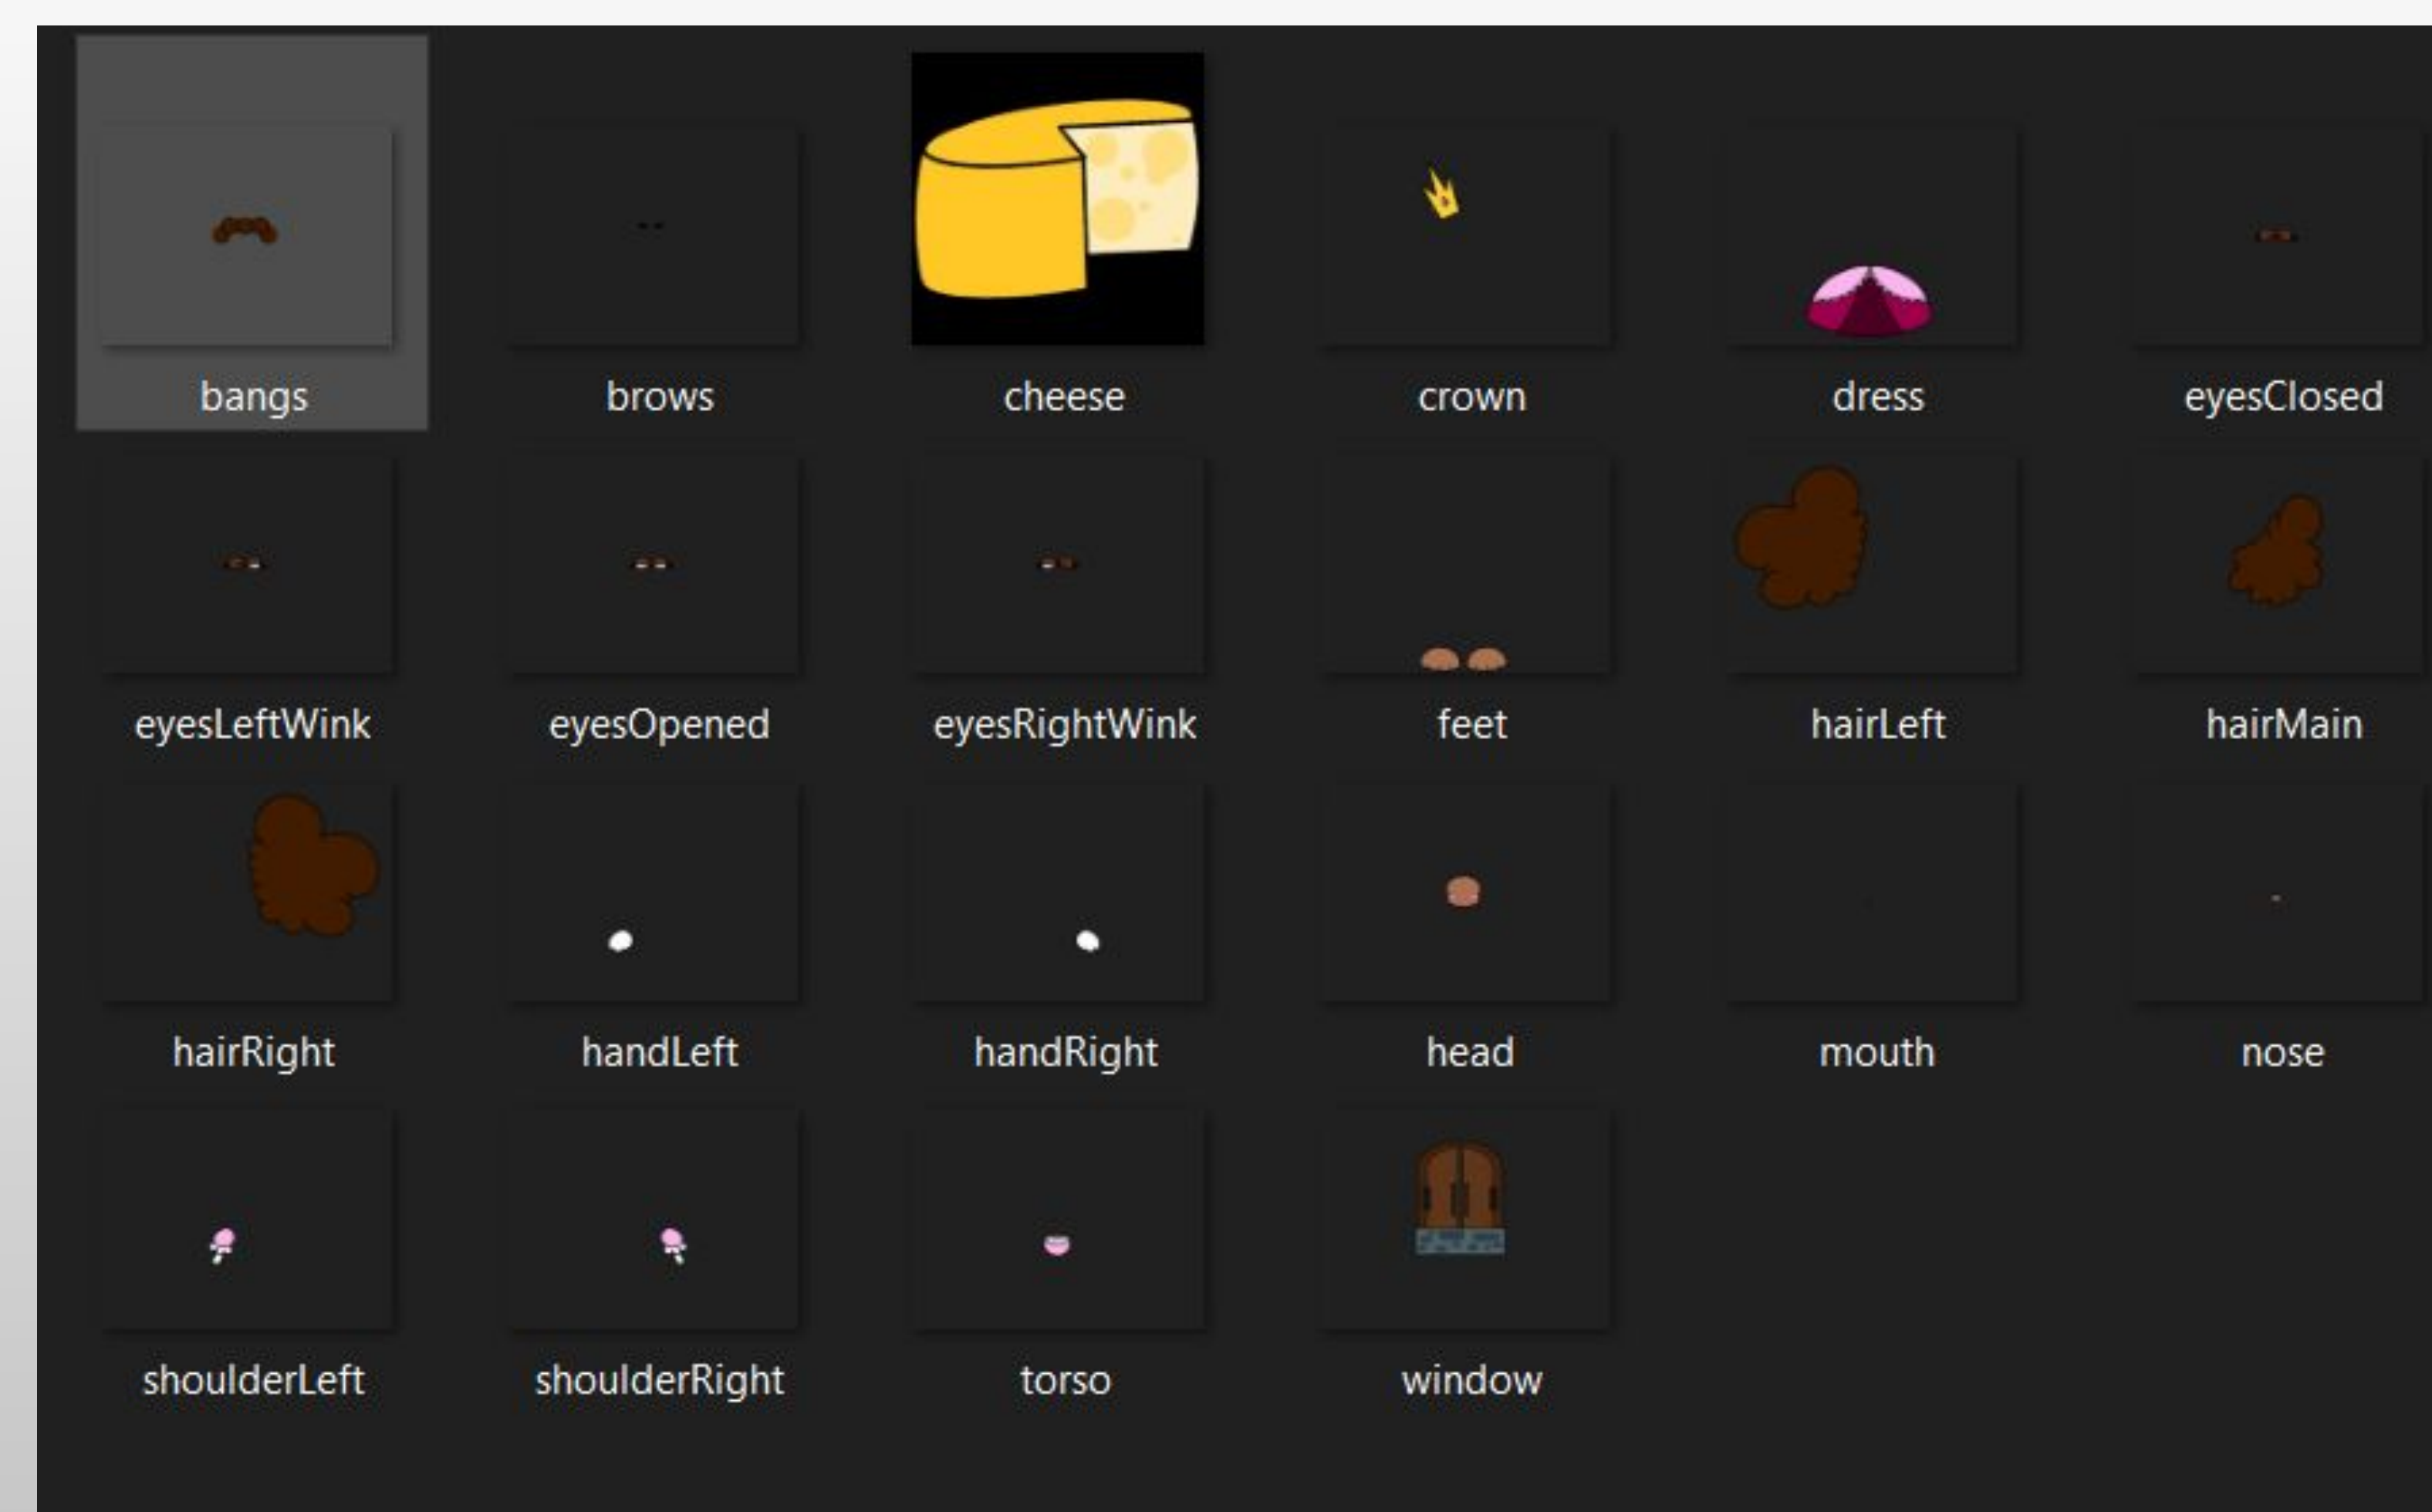

Bryan Cruz and Tyler Knapp

Description

For this project, we set out to create a webpage application similar in style to a Tamagotchi, virtual pet, or Talking Tom if one isn't familiar with Tamagotchi. The character featured, a princess named Aya, is an original creation by Bryan Cruz, and you can interact with her similar to those aforementioned apps/devices.

Animations/Images

Princess Aya has 3 spots that can be clicked on to trigger small animations. When clicked on, the image will change or animate for five seconds before returning back to their original state, a neutral, default animation. This was done by using DOM elements in the javascript. The images were layered out individually using CSS and HTML formatting,

Software

Visual Studio Code was the primary software used to code the HTML, CSS, and JS code. iBisPaint was used to create the drawn assets

Reflection

Ultimately, a fulfilling project that tested the bounds of what we learned over the course of this semester in terms of HTML, CSS, and JavaScript, using all three languages in tandem to bring this character to life.
